1. Introduction

Biziness 2.0 is a premium HTML and CSS website template for yourself, your client, your business or your organization. This template has been designed to be as adaptable as possible, featuring an easy to use javascript configuration file, multiple ready to use layouts, 5 full colour schemes and full documentation to get you started.

The template itself is a fixed width which can handle either a three, two or single column layout with a sidebar on either the right or the left. All code is valid XHTML 1 Strict and CSS 2.1 and has been tested on all major browsers including IE6, IE7, IE8, Firefox 3 and Google Chrome.

1.1 Package contents

This template package contains the following files:

- 5 fully coded colour schemes (turquoise, red, blue, orange, green directories)
- jQuery javascript library (jquery-1.2.6.min.js file)
- Front page slider (jquery.flow.1.2.js file)
- Drop down menus (supersubs.js file)
- Javascript configuration options (custom.js file)
- Full valid CSS code (<color>/css folder)
- Full documentation (this file)
- The template images (in the <colorur>/images directory)

2. Installation

To install this site template simply upload all HTML files, the /js directory, /images directory and CSS folder of your chosen colour to your web server, it really is as easy as that!

3. Customisation

To change the structure and content of the page open the HTML files in your preferred editor or text editor.

The CSS of this template is split in up to 4 files

core.css contains the main styles and layout for the template, plus the colours for the turquoise layout

core-ie6.css contains fixes for IE6

core-ie7.css contains fixes for BOTH IE6 and IE7

<color>.css contains color styles which override the default turquoise colors found in core.css

3.1 Changing the header text

The first thing you probably want to do is add your site's name to the top of the page. Open the HTML files and change the text in the <h1> tag within the .header DIV. By default this is on line 31 of index.html

The <h2> tag will become the slogan.

In this section you can also fill out subscription options for your users

3.2 Adding, editing and removing menu items

The main menu is found in the .menu div on line 41 of index.html, by default. The navigation is a simple list, to add items use the following template:

```
<li><a href="page.html" title="page title">Menu item text</a></li>
```

Add this *before* the closing tag.

To edit menu items simply change the text which is already there, to remove them just remove the whole list item tag (...)

Premium template documentation

The dropdown menus working by simply nesting lists within one another, you need not add any additional classes or javascript. You should only nest up to 3 lists within the main navigation list to avoid problems on the right hand menu items

3.3 The front page slider

The content of the homepage image slider is found on line 104 in index.html in the #slides div.

To add slides use the following code, add it to inside the #slides div:

```
<div>
    <div class="slide-image"></div>
    <div class="slide-text">
        <h2>slide #1</h2>
        <p>Fusce euismod consetetuer sapien. Fusce ac velit.</p>
    </div>
</div>
```

The content of div.slide-text will be floated to the left and div.slide-image will be floated to the right.

Be sure to also add a new span with class "jFlowControl" inside the #myController div on line 150, e.g.:

```
<span class="jFlowControl"></span>
```

The number of these s in the #myController div should match the number of slides.

3.4 PHP contact form

This template package comes with a working PHP contact form found in contact.php To set it up open the file and scroll to line 100 and fill out the variables – they are all commented to help you.

The PHP contact form will check to make sure an email address and message is given at the minimum before sending the contents of the form to you. The PHP form will send all values of the fields in the form so you can easily add more without editing the PHP at all. Adding more validation requires more work and is outside of the scope of this document. Please visit our forums for help with that.

PLEASE NOTE: There is only one contact.php file included with the core CSS files, to change colour please add one of the <color>.css files!

3.5 The main content and sidebar

The main page content is found in the `.body` div.

If you're using a two column layout, the main content is found in the `.column-600` div.

Again, if you're using a two column layout, the sidebar content is found in the `.column-280` directly after `.column-600`, regardless of whether the sidebar is on the left or right.

3.6 Switching the sidebar and main content around

To switch the two columns around, switch `class="right"` to `class="column-left"` on the `.column-280` div and `class="column-left"` to `class="right"` on the `.column-600` div.

The sidebar should also have a class of `.sidebar`

4. Special classes

There are a number of extra 'special' classes you can use on elements which will give them different properties to the default elements.

4.1 input.formbutton

This classes is made for the use on submit and other form buttons but can be applied to any input. It matches the input with the rest of the style, adding a blue background and border and white text. See contact.html for an example.

```
<input type="submit" name="submitform" value="Send message"
class="formbutton" />
```

4.2 img.fadeimg

An image with class of "fadeimg" will add an opacity of 0.7 which will change to 1.0 on hover. The default opacity can be changed in custom.js

4.3 ul.servicelist

This list provides a one-column list with icons. Icons are added using the classes. If an invalid class is given a question icon is displayed:

Fusce ac velit. Nunc ut eros vitae magna tristique volutpat. Suspendisse potenti.

Ut rhoncus feugiat libero. In interdum, leo mollis blandit feugiat.

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Pellentesque venenatis sagittis enim.

Fusce sit amet nulla ac velit commodo mattis. Ut tristique neque nec lorem.

Valid classes, included by default, include image-icon, chart-icon, user-icon and search-icon.

Premium template documentation

4.4 ul.newslist

This class can be used to create a list of news items (or blog posts, releases, etc.)

The syntax of the list items in a list is as follows:

```
<li>
    <a href="#">Ut sollicitudin molestie tortor id</a>
    <span>15.02.09</span>
</li>
```

The contents of the could be a date, filesize or category. It is floated to the right with a left border.

4.5 div.greybox, div.colorbox

This class can be added to divs within the sidebar (and elsewhere) to provide simple coloured boxes as is demonstrated on the contact page (contact.html)

.colorbox will be styled with the colours of the current layout.

4.6 *.clear

This class is designed to clear floats

5. Javascript

This template uses some Javascript to provide better usability and more effects on the web page. All javascript files are stored in the /js directory.

There are 5 files included:

- jquery-1.2.6.min.js - jQuery, a javascript library so you and I don't have to write as much code

- jquery.flow.1.2.js – the code for the front page slider

- superfish.js - the code for the drop down menus

- custom.js – contains configuration options (see below) and other custom code written specifically for this template

For more information on jQuery see: <http://jquery.com>

For more information on jFlow (front page slider) see:

<http://www.gimiti.com/kltan/wordpress/?p=46>

For information on superfish - the code for the drop down menus - see:

http://users.tpg.com.au/j_birch/plugins/superfish/

5.1 Configuration option

Open custom.js within the /js directory to change some simple javascript settings.

Change the value of opacity to change the default opacity of images with class 'fadeimg'

6. Contact and support

To get support for this template please either go to our webmaster forums at

<http://www.spyka.net/forums> (use Premium Content>Support forum!) or email us via our

contact form at <http://www.spyka.net/contact>
